Tally Solutions Pvt. Ltd. is a pioneer in the business software products arena. Since its inception in 1986, Tally's simple yet powerful products have been revolutionizing the way businesses run. Having delivered path breaking technology consistently for more than 30 years, Tally symbolizes unmatched innovation and leadership. Today, it caters to millions of users across industries in 140 countries and continues unchallenged as the industry leader in the enterprise resource planning software domain.

Tally.Server 9

An enterprise-class product and a powerful data server that will redefine the efficiency of medium and large businesses.

Tally.Server 9 helps enhance the power and control of Tally.ERP 9 Gold users by converting the existing 'peer-to-peer' kind of data access to 'server based' data management.

The Tally.Server 9 technology is built with multi-threaded capabilities, such that requests from every user get equal priority and get solved in parallel with others, rather than sequentially. There is no queuing of access or modification requests and so every user will feel as if he were working with his own local copy or snapshot of data. Tally.Server 9 will ensure that the data access/modification by a user is isolated to his/her own snapshot, thus allowing other users to operate smoothly.

In other words, with Tally.Server 9, there is essentially no blocking of another user's tasks, even as new users keep getting added to the system, or because of the types of tasks being performed. It also maintains very high data consistency in intense use environment. Overall it leads to lower cost of ownership, lower maintenance and higher efficiency of operations for any medium to large business needing an enterprise grade system.

Product Highlights

High Concurrency

Performing operations in a frictionless environment.

In a growing multi-user environment, provides a scalable platform for adding users without compromising on performance - multiple users will be able to simultaneously load companies, save transactions, export reports, print reports, import data, take backup and perform other data related activities without experiencing any downtime or wait state.

All users will be able to work faster without impacting each other's access to data, thereby increasing organizational efficiency.

Improved Security

Keeping the data file safely invisible and providing controlled access

With data files now being managed through Tally.Server 9, the physical local or path for data on the server is not required to be made known or accessible to any user. Clients just require the name of the data server, which will be enough to access and operate Tally.ERP 9. Furthermore, operations for company data management like backup, restore etc. are also controlled with

server level permissions. This will ensure that data managed by Tally.Server 9 is only available with necessary authorization.

The administrator/business owner will be able to control the visibility of physical data files and the rights for administrative operations of all users, thereby minimizing risks like data misuse and accidental deletion of data.

High Reliability

Minimizing instances of system unavailability

Availability of the system is important for any business. Anytime the system is unavailable; there is loss of productive time. Users will not experience downtime for maintenance operations like backup. The system ensures data consistency even in intense user environments and has zero impact of any abnormal client shutdown. This allows for more frequent data backups, thus minimizing data loss.

With Tally.Server 9, maintenance operations like backup can be taken at any time without affecting either the speed of access for the users or the consistency of data that is backed up. In other words users can continue entering transactions or operating reports while the backup process is on.

Business Process Optimization

Analyzing system usage and user activities to optimize the various processes and time spent on them

Since the access is controlled through Tally.Server 9, authorized users will be able to monitor who is currently logged in, which companies are open, track activities, and even disconnect users if such a requirement arises. The monitoring will help discover and optimize processes or system usage for enhanced productivity which would otherwise be extremely difficult to analyze.

The administrator/business owner will be able to monitor which users are currently logged in, track their activities and even disconnect them if required. They will be able to view real-time information on usage of the system, patterns of user activities and areas where more time is spent and thereby optimize productivity. The administrator will also be able to prioritize tasks.
